Veterinary Report On Broodmare for Sale

This is a report on the reproductive examination of "Secret Gold", a 4 year old bay thoroughbred mare by "Needs Further" from "Oh So Gold" performed on 2 June 2020. Her microchip was 985100012100458. Near side brand of ∇ and an off side brand of 15 over 5.

The mare is a maiden and was examined under mild sedation. At the time she had never been served and thus not pregnant. External examination of vulva was within normal limits and she had not been caslicked. Vagina and cervix were examined manually and with speculum and did not present any abnormalities.

Rectally, the reproductive organs palpated normally. On ultrasound scan, the right ovary was 3.2 cm x 4.5 cm in size and had a largest follicle of 0.8mm. The left ovary was 3.3 cm x 4.9 cm in size and had a largest follicle of 1.1mm. Both ovaries had normal architecture.

The uterus was in anoestrus and did not present with any cysts or fluid. The cervix and vagina were also within normal limits on ultrasound.

Lastly, the udder was only visually inspected and appeared without abnormality.

Please note this examination is of limited assessment of the reproductive breeding soundness and should not be relied on as a representation or expression of opinion as to the breeding soundness.

Sincerely,

Dr Isabel Collier BVM&S
